in the plasma. The integration of $v_\parallel$ is from $-\infty$ to $+\infty$. Eq. (2.3) may be obtained also when using the general equation for ε_{ij} (obtained by V. D. Shafranov). The tensor ε_{ij} is represented in the form $\varepsilon_{ij} = \varepsilon_{ij}^{(0)} + \varepsilon'_{ij}$ (2.4), where $\varepsilon_{ij}^{(0)}$ denotes the tensor of the dielectric constant of the "cold" plasma, whose components are given by (2.5):

$$\varepsilon_{xx} = \varepsilon_{yy} = 1 - \sum_s \frac{\omega_s^2}{\omega^2 - \omega_{Hs}^2}, \quad \varepsilon_{zz} = 1 - \sum_s \frac{\omega_s^2}{\omega^2}, \quad \varepsilon_{xy} = -\varepsilon_{yx} = -\sum_s \frac{i\omega_s^2 \omega_{Hs}}{\omega(\omega^2 - \omega_{Hs}^2)}, \quad \varepsilon_{xz} = \varepsilon_{yz} = 0. \tag{2.5}$$

The summand ε'_{ij} is due to the presence of the beam. Should the inequalities $k_\parallel^2 (v_\parallel - v_0)^2 \ll (\omega - s\omega_{Hs} - k_\parallel v_0)^2$ and $k_\perp v_\perp \ll |\omega \pm \omega_{Hs}|$ hold, if $v_0 = \bar{v}_\parallel$ is the drift velocity of the beam, the thermal motion of the particles need not be taken into account, where (2.6)

TITLE: Cyclotron instability in plasma

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 2, 1961, 176-179

TEXT: It is known that the anisotropy of the equilibrium distribution of plasma electrons and ions with respect to velocity may lead to instabilities. The present paper deals with the instability of an unbounded plasma in a homogeneous magnetic field H_0 if ions with an equilibrium distribution function of the form (1)

$$f_0 = \frac{\omega_j - k_\parallel v_0 + i\varepsilon}{|\omega_H|}$$

occur in the plasma, where n_0 the density of the ions, $v_\perp$ and $v_\parallel$ the perpendicular and parallel components, respectively, of the ion velocity. The ions with the distribution function (1) have the same Larmor radius $r_0 = v_0/\omega_H$, where $\omega_H = eH_0/Mc$ and M the mass of the ion. It is demonstrated

Cyclotron instability in plasma

that disturbances of a wavelength of the order of r_0 and frequencies which are equal to or a multiple of the gyrofrequency ω_H are unstable (cyclotron instability). The order of magnitude of the growth increment is equal for the first harmonics. It may be expected that the results obtained for an unbounded plasma will be qualitatively also correct for adiabatic traps. First, the case is studied where the thermal scattering of ion velocities parallel to H_0 can be neglected. Hence, it may be assumed that $f_0(v_\parallel) = \delta(v_\parallel)$. The tensor of the dielectric constant in this case has form (2),

$$\left.\begin{aligned} \varepsilon_{11} &= -\frac{\Omega^2}{\omega^2}\left[1 + \sum_{n=-\infty}^{\infty}\left(\frac{2\omega_H n^2 J_n J_n'}{(\omega^2 - n\omega_H)\alpha} + \frac{\alpha v_\perp^2 \omega_H^2 n^2 J_n^2}{(\omega^2 - n\omega_H)^2}\right)\right], \\ \varepsilon_{12} &= -\frac{\Omega^2}{\omega^2}\left[1 + \sum_{n=-\infty}^{\infty}\left(\frac{\omega_H n \left(\alpha^2 J_n'^2\right)'}{(\omega^2 - n\omega_H)\alpha} + \frac{\alpha v_\perp^2 \omega_H^2 n^2 J_n J_n'}{(\omega^2 - n\omega_H)^2}\right)\right], \end{aligned}\right\} \quad (2)$$

"APPROVED FOR RELEASE: 09/17/2001 CIA-RDP86-00513R000722920011-7

Cyclotron instability in plasma

Maxwellian velocity distribution, (3) holds

$$\varepsilon_{ij} = \frac{\Omega_e^2}{k_\parallel^2 v_e^2}\left[1 + i\sqrt{\pi}\, w(z_e)\right], \quad v_e^2 = \frac{T_e}{m},$$
$$w(z_e) = e^{-z_e^2}\left(\frac{-k_\parallel}{|k_\parallel|} + \frac{2i}{\sqrt{\pi}}\int_0^{z_e} e^{t^2} dt\right), \quad z_e = \frac{\omega}{\sqrt{2}\, k_\parallel v_e}, \qquad (3)$$

where Ω_e the Langmuir electron frequency. The solutions are then obtained for the dispersion relations for electromagnetic waves near $\omega_s = s\omega_H$ in the plasma (Ref. 1):

$$\omega' = \omega_s + \xi, \quad |\xi| \ll \omega_H, \quad s = 0, \pm 1, \pm 2, \qquad (4).$$

If the quantity $a = k_\perp r_0$ is not too low and the number of the harmonics s not too high, the last summands for ε_{ij} in equation (2) $\sim 1/(\omega' - s\omega_H)^2$ are the highest. Taking account of this fact

$$\varepsilon^1 = -\frac{\Omega^2 \omega_H^2}{k_\perp^2 c^2}\left(s^2 J_s^2 + \cos^2\theta\, \sigma^2 J_s'^2\right) + \frac{\Omega^2 k_\parallel^2 v_e^2 J_s^2}{\Omega_e^2\left[1 + i\sqrt{\pi}\, z_e w(z_e)\right]}, \qquad (5)$$

Card 4/8

APPROVED FOR RELEASE: 09/17/2001 CIA-RDP86-00513R000722920011-7"

"APPROVED FOR RELEASE: 09/17/2001 CIA-RDP86-00513R000722920011-7

Cyclotron instability in plasma

holds, where $z_e = \omega_g/\sqrt{2}\, k_{\parallel} v_e$. If $a \sim 1$, $|z_e| \sim v_\sigma/v_e$. If it appears from (5) that $\gamma = \mathrm{Im}\, t > 0$, the plasma is unstable. This is always the case when the first summand in (5) is greater than the second one, and also for $|z_e| \gg 1$, if (6).

$$\gamma^2 = -\omega^2 = \frac{\Omega_e^2 \omega_e^2}{k_\perp^2 c^2}\left(a^2 J_1'^2 + \cos^2\beta a^2 J_1^2\right) + \frac{\Omega^2 \omega_i^2 J_1^2}{\Omega_i^2}.$$

Finallly the case is dealt with where the thermal motion of the ions is essential. For reasons of simplicity, function $f_0(v_{\parallel})$ is assumed to be of Maxwellian type, i.e., (7)

$$f_0(v_{\parallel}) = \frac{1}{\sqrt{2\pi}\, v_i} \exp\left(-\frac{v_{\parallel}^2}{2v_i^2}\right), \qquad v_i^2 = \frac{T_i}{M}.$$

Cyclotron instability in plasma

The authors studied the occurrence of the instability for frequencies near ω_s. As may be seen from (5), the growth increment is small compared with the frequency if $v_0 \ll v_A$. For high-density plasmas, where $\Omega \gg \omega_H$, stronger instabilities occur in the case of disturbances with a wavelength of the order of r_0, for which growth frequency and increment are in the order of ω_H. In this case ω and γ can be determined only numerically.

There is 1 Soviet-bloc reference.

AUTHOR: Kitsenko, A. B.

TITLE: Character of the instability in the interaction of a beam with plasma in an outer magnetic field

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 31, no. 10, 1961, 1270 - 1271

TEXT: A convective instability can only be eliminated if its character is known. This article deals with the excitation of h-f longitudinal electron oscillations during the passage of a charged particle beam through plasma in an outer magnetic field. The resulting instability is convective in the absence of a magnetic field (Ref. 3. see below). A similar instability occurs in an outer magnetic field due to cyclotron excitation on the basis of the anomalous Doppler effect. This instability is investigated in the following. Integrals of the form $\int a(\vec{k})\, e^{i\vec{k}\vec{r} - i\omega t}\, d\vec{k}$ describe the electric and the magnetic field strength and can be used to distinguish between the absolute and the convective instability. If this integral tends to zero for any constant $\vec{r}$ with $t \to \infty$, the instability will be convective, and if it tends to infinity, it will be absolute. The integral

B[illegible]/B[illegible]

Character of the instability in the [illegible] may also be written as $\int_C a[k(\omega)] \frac{e^{-i\omega t}}{\frac{d\omega}{dk}} d\omega$, where C is the mapping of the real axis of the k-plane on the ω plane. The values of $\omega = \omega_0$ for which $d\omega/dk = 0$, are found from the dispersion equation to be $\omega_0^2 = \omega_H^2(1 + \eta \pm \sqrt{(1+\eta)^2 - 4\cos^2\theta\,\eta})/2\eta$, where $\eta = \frac{\omega_H^2 - \Omega^2}{\Omega^2}$, ω_H is the electron cyclotron frequency; ω and Ω are the Langmuir frequencies of plasma and beam; θ is the angle between $\vec{H}_0$ and $\vec{k}$. The dispersion equation shows that C cuts the imaginary axis only in $\omega = 0$. The contour C can be deformed such that it lies in the lower semiplane ω, i.e., that the integral for $t \to \infty$ tends to zero.

TITLE: Interaction between charged particle currents and low-frequency plasma oscillations

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 40, no. 6, 1961, 1866-1870

TEXT: The authors deal with the interaction between a compensated beam of charged particles and the low-frequency oscillations of a plasma (mainly with the magneto-acoustic waves and the Alfvèn waves) in a constant field in parallel direction to the beam and in the absence of collisions. If the plasma is rarefied to such an extent that the frequency ω of the oscillations is much higher than the frequency $1/\tau$ of the collisions, the plasma oscillations must be described on the basis of the kinetic equation. With $\omega\tau \ll 1$ the plasma can be described hydrodynamically. The authors studied the case $\omega\tau \gg 1$. The general dispersion equation for plasma oscillations in an external magnetic field with random distribution function of the particles with respect to the velocities

reads as follows: $An^4 + Bn^2 + C = 0$ (1) where $n = kc/\omega$. The wave vector $\vec{K}$ and the quantities A, B, and C are determined by the components of the tensor of the dielectric constant ε_{ij}. Furthermore, it is assumed that $\omega \ll \omega_{Hi}$, $kv_0 \ll \omega_{Hi}$ where ω_{Hi} is the gyrofrequency of the ions, $v_i = (T_i/M)^{1/2}$ the mean thermal velocity of the ions (T_i denotes the temperature and M the mass of the ions) and v_0 the velocity of the beam. Under these conditions (1) falls into the equations $(kc/\omega)^2 \cos^2\theta - \varepsilon_{11} = 0$ (3) and $(kc/\omega)^2 - \varepsilon_{22} - \varepsilon_{23}^2/\varepsilon_{33} = 0$ (4) describing the Alfvén wave and the sound wave, respectively. If the velocity distribution of the particles in the beam has the form

$$f_{e,i} = n_0' \left(\frac{m_{e,i}}{2\pi T_{e,i}'}\right)^{3/2} \exp\left\{-\frac{m_{e,i}(v - v_0)^2}{2T_{e,i}'}\right\} \quad (5)$$

(n_0' density of the particles in the beam, T_e', T_i' temperatures of the electrons and ions of the beam, $m_e = m$, $m_i = M$)

for the frequency of the Alfvèn wave modified by the existence of the beam is obtained from (3). Due to the excitation of the Alfvèn waves the state of the system plasma - beam is unstable if condition

$$v_0^2 > V_A^2 + V_A'^2, \quad (8)$$

where $V_A = H_0/\sqrt{4\pi n_0 M}$, $V_A' = H_0/\sqrt{4\pi n_0' M}$,

is fulfilled. With sufficiently low densities of the beam the excitation of the Alfvèn waves is impossible as long as the coupling between the Alfvèn waves and the magneto-acoustic waves is neglected. When considering this coupling an instability is observed also with those densities at which (8) is not valid. In the following study of the beam by means of the magneto-acoustic waves the density of the beam is assumed to be small as compared to the plasma density. With $kv_i \ll \omega \ll kv_e$ the solution of the dispersion equation (4) has the form

$$\omega_\pm = kV_\pm, \quad V_\pm^2 = \frac{1}{2}\left(V_A^2 + s^2 \pm \left[(V_A^2 + s^2)^2 - 4V_A^2 s^2 \cos^2\theta\right]^{1/2}\right). \quad (9)$$

with locking beam, where $s = (T_e/M)^{1/2}$. With $V_A \sim s$ the quantities $V_\pm$ are also of the order of magnitude s. In this case the condition $\omega \gg kv_i$

Card 4/7

Interaction between charged ...

holds only for a strongly nonisothermal plasma ($T_e \gg T_i$) while the magneto-acoustic waves with $T_e \lesssim T_i$ are strongly attenuated. Besides, also $|\omega - k_\parallel v_0| \gg kv_e'$ holds. The dispersion equation (4) then reads as follows: $\omega = k_\parallel v_0 + \xi$ (10) with $|\xi| \ll |k_\parallel v_0|$. Under the conditions studied, the state of the system plasma-beam is unstable due to the excitation of the magneto-acoustic waves. If v_0 does not lie in the interval $s < v_0 < V_A$ this instability occurs even with neglection of η ($|\eta| \ll 1$). With $v_0 \cos\theta \to V_t$, (13) holds. With the maximum (resonance) interaction (with $V_t = v_0 \cos\theta$) the increment of increase of the oscillations is not proportional to $(n_0'/n_0)^{1/2}$ but to $(n_0'/n_0)^{1/3}$. The solutions (10) to (13) of the dispersion equation (4) hold for a strongly nonisothermal plasma. With $T_e \lesssim T_i$,

$$\xi = \left(\frac{M}{m}\right)^{1/3} s_e = \pm \frac{\Omega_0' [n^2 - \varepsilon_{xx}^{(e)}]^{1/3}}{[\varepsilon_{xx}^{(e)} (n^2 - \varepsilon_{xx}^{(i)}) - \varepsilon_{xx}^{(e)2}]^{1/3}}, \qquad (14)$$

Card 5/7

Interaction between charged ...

is obtained with neglection of the thermal motion of the electrons of the beam. ε^0_{ij} is the component of the tensor of the dielectric constant of the plasma without beam with $\omega = k_\parallel v_0$. An instability also occurs with $T_e \lesssim T_i$ if the plasma oscillations are weakly attenuated. With $kv_i' \ll |\omega - k_\parallel v_0| \ll kv_0'$ the thermal motion of the electrons in the beam has to be taken into account. (4) then has the solution $\omega = k_\parallel v_0 + \varepsilon_0$, $|\varepsilon_0| \ll k_\parallel v_0|$ (15) where ε_0 is obtained from (14). If $k_\parallel v_0$ lies near the eigenfrequency $kV_\pm$ of the magneto-acoustic wave in the nonisothermal plasma $\omega = kV_\pm + \varepsilon_0$, $|k(v_0\cos\theta - V_\pm)| \ll |\varepsilon_0|$ (16) holds where ε_0 is to be determined from (13). These formulas hold for sufficiently low temperatures of the beam $|\omega - k_\parallel v_0| \gg kv_i'$. With sufficiently small n_0'/n, $\omega = \omega_\pm + i\gamma_\pm$ holds with

$$\gamma_\pm = -\frac{\sqrt{\pi}\omega_p \sin^2\theta\,(\zeta_i + \zeta_i' + \zeta_i')}{4\zeta_\pm^3|\cos^2\theta - \zeta_\pm|(\zeta_+ - \zeta_-)}, \qquad \zeta_\pm = \left(\frac{V_\pm}{v}\right)^2.$$

TITLE: Excitation of magnetosonic waves in dilute plasma by a charged particle flow

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 3, 1962, 303 - 307

TEXT: The excitation of "fast" and "slow" magnetosonic waves in dilute plasma by a charged particle flow of arbitrary density was studied. The following assumptions were made: The Alfvèn velocity is much greater than the sonic velocity, plasma and particle flow are dilute so that "near" collisions may be neglected, space charge and electric current of the particle flow are compensated in the state of equilibrium. The dispersion equation for magnetosonic waves

$$\frac{k^2c^2}{\omega^2} - \varepsilon_{22} - \frac{\varepsilon_{23}^2}{\varepsilon_{33}} = 0 \quad (1)$$

is written down, where ε_{ij} is the tensor of the dielectric constant (axis 3 runs parallel to the external magnetic field $\vec{H}_0$, the wave vector $\vec{k}$ is in the 1-3 plane). (1) holds if $\omega \ll \omega_{Hi}$,

$kv_i \ll \omega_{Hi}$, $kv_o \ll \omega_{Hi}$, where ω_{Hi} and v_i = hydrogen frequency and mean thermal velocity of ions respectively, v_o = beam velocity ($\vec{v}_o \parallel \vec{H}_o$). If beam and plasma particles show Maxwellian velocity distribution, the components of ε_{ij} are:

$$\left.\begin{aligned}
\varepsilon_{11} &= 1 + \sum_a \frac{\Omega_a^2 (\omega - k_\parallel v_a)^2}{\omega_{Ha}^2 \omega^2}, \\
\varepsilon_{22} &= \varepsilon_{11} + \sum_a \frac{\Omega_a^2 k^2 v_a^2}{\omega_{Ha}^2 \omega^2} 2i\sqrt{\pi} \sin^2\theta z_a w(z_a), \\
\varepsilon_{33} &= 1 + \sum_a \frac{\Omega_a^2}{k_\parallel^2 v_a^2} (1 + i\sqrt{\pi} z_a w(z_a)), \\
\varepsilon_{13} &= -\sum_a \frac{\Omega_a^2}{\omega_{Ha}\omega} \operatorname{tg}\theta \sqrt{\pi} z_a w(z_a),
\end{aligned}\right| \qquad (2)$$

$$w(z_a) = e^{-z_a^2}\left(\pm 1 + \frac{2i}{\sqrt{\pi}} \int_0^{z_a} e^{t^2} dt\right), \quad z_a = \frac{\omega - k_\parallel v_a}{\sqrt{2} k_\parallel v_a},$$

$$\Omega_a^2 = \frac{4\pi e^2 n_{oa}}{m_a}, \quad v_a^2 = \frac{T_a}{m_a}, \quad \omega_{Ha} = \frac{e_a H_o}{m_a c}, \quad k_\parallel = k\cos\theta,$$

Excitation of magnetosonic...

θ is the angle between $\vec{k}$ and $\vec{H}_0$. First, the oscillations corresponding to the "fast" magnetosonic wave are investigated. It is assumed that $\omega/k \gg v_i$, v_i', $v_0\sqrt{m/M}$, $v_e'\sqrt{m/M}$, the indices e and i denote electrons and ions respectively, the primes refer to beam particles. The solution of (1) is $\omega = \omega_\pm$, where

$$\omega_\pm = k\frac{n_0'v_0\cos\theta \pm \sqrt{n_0'n_0(V_A^2 + V_A'^2 - v_0^2\cos^2\theta)}}{n_0' + n_0}, \qquad (3)$$

$$V_A = \frac{H_0}{\sqrt{4\pi n_0 M}}, \quad V_A' = \frac{H_0}{\sqrt{4\pi n_0' M}}.$$

From (3) follows the instability condition $v_0^2 > V_A^2 + V_A'^2$. Consideration of the kinetic effects shows that instability may also occur at $v_0^2 < V_A^2 + V_A'^2$. In this case, $\omega = \omega_\pm + i\gamma_\pm$, $|\gamma_\pm| \ll |\omega_\pm|$. On the above assumptions, the dispersion equation for "slow" magnetosonic waves reads $\varepsilon_{33}(\omega, \vec{k}) = 0$ (6). For the case $|\omega - k_\parallel v_0| \gg kv_e'$, (6) gives

Card 3/5

"APPROVED FOR RELEASE: 09/17/2001 CIA-RDP86-00513R000722920011-7

Excitation of magnetosonic...

$$\frac{\Omega_i^2}{\omega^2}+\frac{\Omega_i'^2}{(\omega-k_\parallel v_0)^2}=\frac{\Omega_i^2}{k_\parallel^2 s^2}(1+i\sqrt{\pi}z_i), \qquad (7)$$

where $s = T_e/M$ is the sonic velocity, $z_e = \frac{\omega}{\sqrt{2}|k_\parallel| v_e}$ ($|z_e| \ll 1$). If $z_e=0$, the instability condition

$$\omega_0^2 < \frac{s^2}{n_0}\left[n_0'^{1/3}+\left(n_0'\frac{M}{m}\right)^{1/3}\right]^3. \qquad (8)$$

is obtained. Explicit formulae for the increments γ can be obtained from (7) for some limiting cases only. For the case $kv_i' \ll |\omega - k_\parallel v_0| \ll kv_e'$, (6) gives

$$\frac{\Omega_i^2}{\omega^2}+\frac{\Omega_i'^2}{(\omega-k_\parallel v_0)^2}=\frac{\Omega_i^2}{k_\parallel^2 s^2}(1+i\sqrt{\pi}z_i)+\frac{\Omega_i'^2}{k_\parallel^2 s'^2}(1+i\sqrt{\pi}z_i'). \qquad (12)$$

Neglecting z_i and z_i', the instability condition

$$v_0^2 < \frac{s^2 s'^2 (n_0^{1/3}+n_0'^{1/3})^3}{n_0 s'^2 + n_0 s^2} \qquad (13).$$

Card 4/5

"APPROVED FOR RELEASE: 09/17/2001 CIA-RDP86-00513R000722920011-7

Excitation of magnetosonic...

is obtained. The solution of (12) can be found explicitly in some special cases. For $|\omega - k_\parallel v_0| \ll kv_i'$, (7) gives $\omega = k_\parallel u + i\gamma$, where

$$\frac{1}{v_i'^2} = \frac{1}{v_i^2} + \frac{n_0'}{n_0}\left(\frac{1}{v_i^2} + \frac{1}{v_e^2}\right),$$

$$\gamma = -\sqrt{\frac{\pi}{8}}\omega_{Hi}\left|\sqrt{\frac{m}{M}}\frac{u}{v_i^2} + (u - v_0)\frac{n_0'}{n_0}\left(\sqrt{\frac{m}{M}}\frac{1}{v_i^2} + \frac{1}{v_e^2}\right)\right|. \quad (18)$$

Then the instability condition is $$v_0 - u > \frac{n_0 m v_i'^2}{n_0' M\left(\sqrt{\frac{M}{m}}v_i^2 + v_e^2\right)}. \quad (19)$$

namic waves in interpenetrating plasma streams with nonisotropic particle velocity distribution functions, are considered on the basis of the quasihydrodynamic equations. It is confirmed on the basis of these equations that one-dimensional Langmuir oscillations of an electron gas can be regarded as adiabatic with an adiabatic exponent $\gamma = 3$. The effects of the ions on both high-frequency and low-frequency oscillations are considered. It is shown that anomalous dispersion occurs in both frequencies. In a plasma consisting of two species of ions, plasma resonance in the region of both high and low frequencies has the same distinguishing features, namely the limitation of the growth of the refractive index because of the presence of thermal motion of the plasma particles, and the appearance of a new branch of oscillations (plasma waves) with anomalous dispersion properties. An experimental investigation of the propagation of radio waves through a plasma at resonance makes it possible to determine several important characteristics of the plasma. The excitation of magnetohydrodynamic waves when streams

TITLE: On the cyclotron excitation of magneto-acoustic waves by a stream of charged particles

SOURCE: Zhurnal tekhnicheskoy fiziki, v.35, no.3, 1965, 470-474

TOPIC TAGS: plasma beam interaction, plasma stability, magnetic sound wave, cyclotron resonance

ABSTRACT: The authors discuss the interaction of a neutral stream of charged particles with the low frequency oscillations (fast and slow magneto-acoustic waves) of a highly anisothermal plasma in an external magnetic field. The magnetic and kinetic pressures are assumed to be of the same order of magnitude, and the interaction is discussed in the neighborhood of the cyclotron resonance under conditions of the anomalous Doppler effect. The relevant dispersion equation is quoted from earlier work (K.N.Stepanov and A.B.Kitsenko, ZhTF 31,167,1961) and is simplified for the case in which the frequency is low compared with the ion Larmor frequency and the phase velocity is high compared with the ion thermal velocity and low col-

TITLE: Movement of streams of charged particles through a plasma at an arbitrary angle relative to the internal magnetic field

SOURCE: AN UkrSSR. Vzaimodeystviye puchkov zaryazhennykh chastits s plazmoy (Interaction of charged particle beams with plasma). Kiev, Naukova dumka, 1965, 131-136

TOPIC TAGS: plasma magnetic field, charged particle, electron oscillation

ABSTRACT: The excitation of high frequency electron oscillations by a relativistic beam of charged particles moving in an arbitrary direction relative to the internal magnetic field is studied. The main interaction effect is assumed to take place where the wave frequency exceeds the cyclotron frequency of the beam and the wavelength is small compared with the cyclotron radius. The analysis of the tensor giving the dielectric properties of such interacting system gives the rate of growth of ordinary and extraordinary waves. The simplifying assumption which considers only waves with phase velocity much smaller than that of light yields a simple expression for the growth coefficients. In addition, so-called "whistler waves" are considered as a special case, where it is shown that small phase velocity waves are most effectively

TITLE: Excitation of longitudinal oscillations in a magnetoactive plasma

SOURCE: AN UkrSSR. Vzaimodeystviye puchkov zaryazhennykh chastits s plazmoy (Interaction of charged particle beams with plasma). Kiev, Naukova dumka, 1965, 136-142

TOPIC TAGS: magnetoactive plasma, Cerenkov radiation, Doppler effect, plasma oscillation, plasma instability

ABSTRACT: This work investigates the excitation of longitudinal oscillations in a plasma consisting of two types of ions through which a stream of particles is moving under an arbitrary angle to the direction of the internal magnetic field. The dispersion relation for the plasma is analyzed and the relationship between its four roots is studied. In the presence of the stream, a new dispersion relation is written consisting of that for the plasma and the added term for the beam and for the interaction effects. This relationship is studied for the case of a cold stream under the conditions of Cerenkov resonance and for the case of a cold stream under conditions of anomalous Doppler effect. In addition, "hot" beam interaction with the plasma is briefly discussed. The instability criteria and growth rates for the various waves is given under speci-

TITLE: Introduction of the oil well impulse neutron generator IGN-1

SOURCE: USSR, Gosudarstvennyy geologicheskiy komitet. Osoboye konstruktorskoye byuro. Geofizicheskaya apparatura, no. 27, 1966, 141-145

TOPIC TAGS: neutron, petroleum industry equipment, temperature instrument, petroleum engineering/ IGN-1 petroleum industry equipment

ABSTRACT: This paper describes modifications of the oil well neutron impulse generator IGN-1, done locally to improve field operations under higher temperatures. To decrease heat generation, permanent magnets were substituted for the electromagnet of the ion source of the accelerating tube; oil volume was decreased by redesign, to utilize the available expansion sylphone at higher temperatures; teflon insulated wires installed etc. To improve the registration effectiveness, the thermal neutron counter SNM-20 was replaced by SNM-20a, which required a higher voltage supply. Delay times, channel sensitivities and integration times were modified to increase measurement effectiveness. Tests showed stable operation in oil wells at 70°C. (Design of the IGN-1 apparatus in its entirety is not described, Abstractor).Orig.art. has 4 figures.

TOPIC TAGS: microwave, microwave biologic effect, central nervous system, UHF, human physiology, animal physiology, animal experiment, industrial hygiene

ABSTRACT: In a survey of radio and television stations and establishments which process dielectrics thermally, measurements using various dosimeters showed that field intensities around short- and ultrashort-wave sources were 8—450 v/m and 4—220 v/m, respectively. The reaction speed and accuracy were studied in personnel exposed to

these sources. Chronometric tests, observations of visual motor reactions, and work capacity were studied and are summarized in Table 1.

Table 1. Changes in the physiological functions of duty personnel in two radio stations (%)

Observed parameter	Shift									
	Evening		Day		Night					
					Station I				Station II	
	Station I	Station II	Station I	Station II	Before sleep	After sleep	End of shift	No sleep		
Latent period of positive conditioned reflexes	0.0	0.0	16.1	12.6	2.2	2.2	6.6	0.0	11.1	42.5
Subsequent inhibition	6.9	4.1	24.3	18.7	0.0	2.1	13.0	0.0	8.1	17.3
Disinhibition of differentiation	20.0	10.0	40.0	20.0	60.0	60.0	70.0	30.0	8.1	60.0
Steadiness of attention — Time	21.4	33.0	50.0	21.4	33.0	19.9	33.3	25.0	50.0	36.6
Steadiness of attention — No. of errors	1.5	1.0	2.5	1.0	3.0	3.0	4.0	2.0	2.5	4.0

It was concluded that the action of EMF's is aggravated by inefficient work-rest cycles which lead to shifts in various physiological reactions

and the development of fatigue. To study the mechanism of the effect of EMF's, animals were exposed to 14, 88, and 69.7 Mc fields (5000 v/m intensity). Animals in the ultrashort-wave range were killed within 5 min, while those in the shortwave range died in 1 hr and 40 min. Nonthermal (no integral thermal effect such as increased body temperature) threshold intensity for the ultrashort-wave range was 150 v/m and for the shortwave range, 2250 v/m. Chronic exposure to these intensities (plus exposure to an ultrashort-wave intensity of 300 v/m) did not result in any substantial changes in body weight dynamics compared to control animals. However, a decrease in brain-stem cholinesterase activity occurred more rapidly during exposure to ultrashort waves than exposure to short waves. Both regimens decreased the excitability and weakened the inhibition process in chronically exposed rats. Such exposure also tended to depress brain biopotentials progressively. An ultrashort-wave intensity of 10 v/m and shortwave intensity of less than 50 v/m is a subthreshold irritant. Photos show the results of a cytomorphological examination of neural structures in exposed animals which revealed thickening of neural fibers, swelling and vacuolization of cell protoplasm in the thalamo-hypothalamic area and medulla oblongata, and local karyocytolysis of individual neurons. Shriveling of individual pyramid cells and individual vacuoles in neurons of the brain cortex was noted. Thus, it was found that an ultrashort-wave intensity of 150 v/m and a shortwave intensity of 2250 v/m is more than

sufficient to cause physiological and morphological changes in neural structures and that the intensity of the effect depends on wave range, field intensity, and exposure duration. On the basis of these data, a permissible exposure intensity of 5 v/m is recommended for workers around ultrashort-wave sources and 20 v/m for workers around shortwave sources. ABSTRACT: A method is analyzed for plotting the trigonometric polynomials which for interpolating the values of a given function and values of its derivatives in equidistant modal points. Three cases are analyzed: when an interpolating function is of even parity, odd parity, and random. The given solution can be used for calculating the harmonic corrections, vocoders, and synthesizers, as well as equipment, the calculation of which is based on an approximation of the given function and its derivatives of trigonometric polynomials. ABSTRACT: A lieutenant general in the Communications Corps describes correct methods of using communications equipment and mentions that in the modern combat situation and during reconnaissance information is transmitted continuously to small units. From small units to headquarters, messages are transmitted every 10 to 15 minutes. Information concerning atomic and bacteriological attacks is transmitted immediately. [WS]
